Sequence 11, Applicat Patent No. 6242199
GENERAL INFORMATION:

1, Application US/09077675A 6242199

COUNTRY: USA
ZIP: 07065-0900
COMPUTER READABLE FORM:
MEDIUM TYPE: Diskette
COMPUTER: IBM Compatible
COMPUTER: OF SYSTEM: DOS
SOFTWARE: FASESEQ for Windows Version 2.0
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/077,675A

FILING DATE:

3-JUN-1998

ADDRESS:
ADDRESSE: Merck & Co., Inc.
STREET: P.O. Box 2000, 126 E. Lincoln Ave.

STREET: P.O. CITY: Rahway

STATE:

Ľ

APPLICANT: Pai, Lee-Yuh
APPLICANT: Peighner, Scott C.
APPLICANT: Howard, Andrew D.
APPLICANT: Hong, Sheng-Shung
APPLICANT: Van Der Ploeg, Leonardus
TITLE OF INVENTION: RECEPTOR ASSAY
NUMBER OF SEQUENCES: 16

CLASSIFICATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. This gene encodes a G-protein coupled receptor, and is designated MTL-R1 (also GPR38). Two spliced forms of GPR38 exist, MTL-R1A (see AAY54145) and MTL-R1B is a functional seven transmembrane domain form, and MTL-R1B is a truncated five transmembrane domain, The CMTL-R1B proteins are used to identify agonists and antagonists which can be used for treating gastric motility disorders, functional defects, disorders secondary to neurological disorders, functional defects, infections, stress-related motility disorders, psychgenic disorders, paraneoplastic syndromes radiation induced dysmotility, diabetes, infections, stress-related motility disorders, psychgenic disorders, gastroparesis, gastro-oesophageal reflux disease, constipation, chronic idiopathis pseudo obstruction, acute faecal impaction, psyndrome, non-ulcer dyspepsion, non-cardiac chest pain and diarrhoea. They can also be used in the preparation for colonoscopy, endoscopy and

```
CC receptor complex that involves providing an immobilized receptor, and CC contacting the receptor with a zsig33 peptide (comprising residues 24-37 CC of AB862649), where the receptor binds to the zsig33 peptide. The method CC is useful for purifying cells, purifying a peptide, stimulating signal CC transduction in a cell expressing a receptor. It is also useful for modulating secretion of hormones, neural development and/or utilization, CC gastric contractility, nutrient uptake, secretion of digestive and CC pancreatic enzymes and hormones, secretion of digestive and CC I, secretion of non-zsig33 proteins. It is useful for modulating growth factor CC I, secretion in a mammal having a disease associated with abnormal CC remodeling, low osteoblast levels, cartilage repair and remodeling, CC skeletal dysplasia, immune suppression, obesity, growth retardation, CC dwarfism, wound healing and ovulation induction, treating a mammal having a mammal feedback, such as satiety regulation, glucose absorption and metabolism and neuropathy-associated CC gastrointestinal disorders, and stimulating glucose-induced insuling the protein secretion of meaning the name of secretion is still the protein catabolism and stimulating glucose-induced insuling the protein secretion of meaning the name of the protein secretion of meaning the name of the protein secretion of meaning the name of the protein secretion of meaning the name of the protein secretion of meaning the name of the protein secretion of meaning the name of the protein secretion of meaning the name of the protein secretion of meaning the name of the name of the protein secretion of the name of the protein secretion of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name of the name 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      release in a mammal. The present sequence represents the DNA encoding the short form of motilin receptor, GPR-8B (one of the two isoforms of GPR3B which result from alternative splicing). GPR3B has homology to the human G-protein coupled receptor, GHS-R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Forming reversible peptide receptor complex for purifying cell and peptides, stimulating signal transduction and modulating hormone secretion, involves contacting a receptor with zsig33 polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence encodes splice variant MTL-RIA of the motilin creceptor. The gene encodes a G-protein coupled receptor, and is CC designated MTL-RI (also GPR38). Two spliced forms of GPR38 exist, CC MTL-RIA (see AAY54145) and MTL-RIB (see AAY54146). MTL-RIA is a CC functional seven transmembrane domain form, and MTL-RIB is a truncated CC five transmembrane domain, The MTL-RI proteins are used to identify CC agonists and antagonists which can be used for treating gastric motility CC disorders, functional defects, disorders secondary to neurological CC disorders, functional defects, disorders secondary to neurological CC disorders, diabetes, infections, stress-related motility disorders, provident of the parametric selection, acute faecal CC disorders, chronic idiopathis pseudo obstruction, acute faecal CC constipation, chronic idiopathis pseudo obstruction, acute faecal CC impaction, postoperative ileus, gallstones, infantile collic, irritable bowel syndrome, non-ulcer dyspepsion, non-cardiac chest pain and CC diarrhoea. They can also be used in the preparation for colonoscopy, and and dindaral intubarion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC of AAB62649), where the receptor binds to the zsig33 peptide. The method CC is useful for purifying cells, purifying a peptide, stimulating signal CC transduction in a cell expressing a receptor. It is also useful for CC modulating secretion of hormones, neural development and/or utilization, CC gastric contractility, nutrient uptake, secretion of digestive and CC gancreatic enzymes and hormones, secretion of insulin-like growth factor CC like constant of in a mammal having a disease associated with abnormal CC levels of growth hormone, such as osteoporosis, bone repair, bone cremodeling, low osteoblast levels, cartilage repair and remodeling, CC skeletal dysplasia, immune suppression, obesity, growth retardation, CC grotein catabolic responses after surgery, cachexia, protein loss, CC dwarfism, wound healing and ovulation induction, treating a mammal having a material disorder requiring neurological feedback, such as satiety capuation, glucose absorption and metabolism and neuropathy-associated crelease in a mammal. The present sequence represents the DNA encoding the long form of motilin receptor, GPR-38 A(one of the two isoforms of compass which result from alternative splicing). GPR38 has homology to the lumn of a contraction contraction content contractive splicing).

                                     The present sequence encodes a human motilin receptor polypeptide. The specification describes an unique sequence present in exon 1 of the dog motilin receptor, which is not present in human or Sphaeroides nephelus 7557 motilin receptor sequences. The unique nucleic acid sequence is useful for measuring the ability of a compound to affect motilin receptor activity. Motilin receptor polymucleotides and polypeptides are used to identify therapeutic compounds which are useful for treating gastrointestinal diseases and disorders such as gastric motility disorders, gastroparesis, irritable bowel syndrome,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This DNA encodes a human GPR38 variant (GPR38V) polypeptide. GPR38V can be expressed by standard recombinant methodology. The polynucleotides and polypeptides are used in the treatment of bacterial, fungal, protozoal and viral infections, infections caused by HIV-1 or HIV-2, pain, cancers, diabetes, obseity, anorexia, asthma, Parkinson's disease, acute heart failure, hypertension, urinary retentions, osteoporosis, allergies, ulcers, migraine, psychotic and neurological disorders, or dyskinesias. They are also useful for identifying agonists and antagonists that are potentially useful in therapy, as vaccines to induce immunological response in a mammal. The polypeptides may also be used as immunogens to produce antibodies immunospecific for the polypeptides, and to identify membrane bound or soluble receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human GPR38V polypeptide and polynucleotide, useful for treating e.g. bacterial, fungal, protozoal and viral infections, cancers or allergies, as vaccines, and for identifying agonists and antagonists potentially useful in therapy

The specification describes an unique sequence present in exon 1 of the dog motilin receptor, which is not present in human or Sphaeroides nephelus 75E7 motilin receptor sequences. The unique nucleic acid sequence is useful for measuring the ability of a compound to affect motilin receptor activity. Motilin receptor polynucleotides and polypeptides are used to identify therapeutic compounds which are useful for treating gastrointestinal diseases and disorders such as gastric motility disorders, gastroparesis, irritable bowel syndrome, and disorders, gastroparesis, irritable bowel syndrome,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes an unique sequence present in exon 1 of the motilin receptor, which is not present in human or Sphaeroides nephelus 7857 motilin receptor sequences. The unique nucleic acid sequence is useful for measuring the ability of a compound to affect motilin receptor activity. Motilin receptor polynucleotides and polypeptides are used to identify therapeutic compounds which are useful for treating gastrointestinal diseases and disorders such as gastric motility disorders, gastroparesis, irritable bowel syndrome,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 813 BP; 65 A; 316 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and diarrhoea.

                                                                                                                                                                                                                                                                                                            CC This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a CC genomic sample of DNA. The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CC DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one CC member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the CC label on the amplicon. From the ratio of labels hybridisated to the two classes of oligomers, the degree of furthylation is calculated. The method CC is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC of the central nervous, cardiovascular, gastrointestinal and respiratory CC systems etc., particularly by detecting mutations or single nucleotide CC types and for investigating cell differentiation. The method allows the CC methylation status of many C residues to be determined simultaneously. CC ABQ11340-ABQ54121 represent genomic DNA sequences used to illustrate the CC method for determining the degree of cytosine methylation described in CC the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a CC genomic sample of DNA. The sample is treated chemically to convert CC cytosine (C) but not methylated C, to uracil, then part of the genomic CC DNA that contains the target C is amplified to form a labeled amplicon. CC The amplion is hybridised to two classes, each with at least one contains the target C is amplified to form a labeled amplicon. CC member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method CC is used: (1) for diagnosis and/or prognosis of side effects of the repeature drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide CC polymorphisms (NDY's), and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. CRECTABG11410-ABG54121 represent genomic DNA sequences used to illustrate the central discrementation of cell or tissue the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           á
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide
                                                                                                                                                                                                                                                                        Claim 12; 56pp + Sequence Listing; 56pp; German.
                                                                                                                                                                                                                                                                                                        Determining the degree of cytosine methylation in genomic DNA, for diagnosis and prognosis, comprises selective hybridization amplicons from chemically treated DNA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-SEP-2000; 2000DE-1043826.
